

AI Gateway: Multi-User Collaboration Guide

How to share your AI power safely

1. Introduction

Your system is now a 'Multi-User Gateway'. This allows you to invite others to your Discord server and allow them to use your AI subscriptions (Gemini Ultra, Claude 3.5, etc.) and your hardware for processing, without compromising your private data.

2. Why Use This Gateway? (Advantages)

- **Access to Elite AI:** Benefit from top-tier subscriptions (Gemini Ultra, Claude 3 Opus) without individual costs.
- **Hardware-Accelerated Power:** Leverage the host's high-performance hardware for complex code generation, data processing, and automation.
- **Collaborative Sandboxing:** Work together on projects in a shared, secure environment where code can be executed and tested in real-time.
- **Privacy-First Memory:** Each user gets a dedicated memory silo. Your private projects and conversation history are never shared with other gateway users.
- **24/7 Autonomy:** Ralph works even when the owner is asleep, processing your queued tasks and monitoring project progress.

3. Core Technical Features

- **Identity Isolation:** Each user has their own unique memory file in 'memory/.json'.
- **Request Queuing:** Ralph manages a fair-use queue. If multiple people ask at once, they see their queue position.
- **Pulse Sharing:** When a 'Pulse' is triggered, Ralph checks the shared INBOX.md for collective project goals.
- **Hardware Lockdown:** Users are restricted to the 'clawd' sandbox folder via Docker hardware virtualization.

3. Commands for Users

Command	Description
Just Chatting	Talk naturally to Clawd or Ralph. Memory is isolated per user.
!task <msg>	Adds a task to the collective INBOX for the next Heartbeat.
!status	Shows the current queue depth and system health.
!queue	Shows pending tasks and high-level project goals.

4. Governance & Safety

As the owner, you have exclusive control over the gateway. Use 'lockdown' to immediately stop all services if you detect suspicious activity. You can also restrict commands to specific 'authorized_users' in 'ralph_config.json'.
